Blue Carbon?

■ Definition & Function of Blue Carbon

- ✓ Carbon storage into marine ecosystem such as coastal vegetations and sediments calls "Blue Carbon"
- ✓ Although the area of marine ecosystem is smaller than that of terrestrial, the total storage of carbon is similar moreover, its rate is up to 50 times faster

Blue Carbon contains 4 marine ecosystem services function

Terrestrial ecosystem "Green Carbon"

Carbon absorbed into forest ecosystem

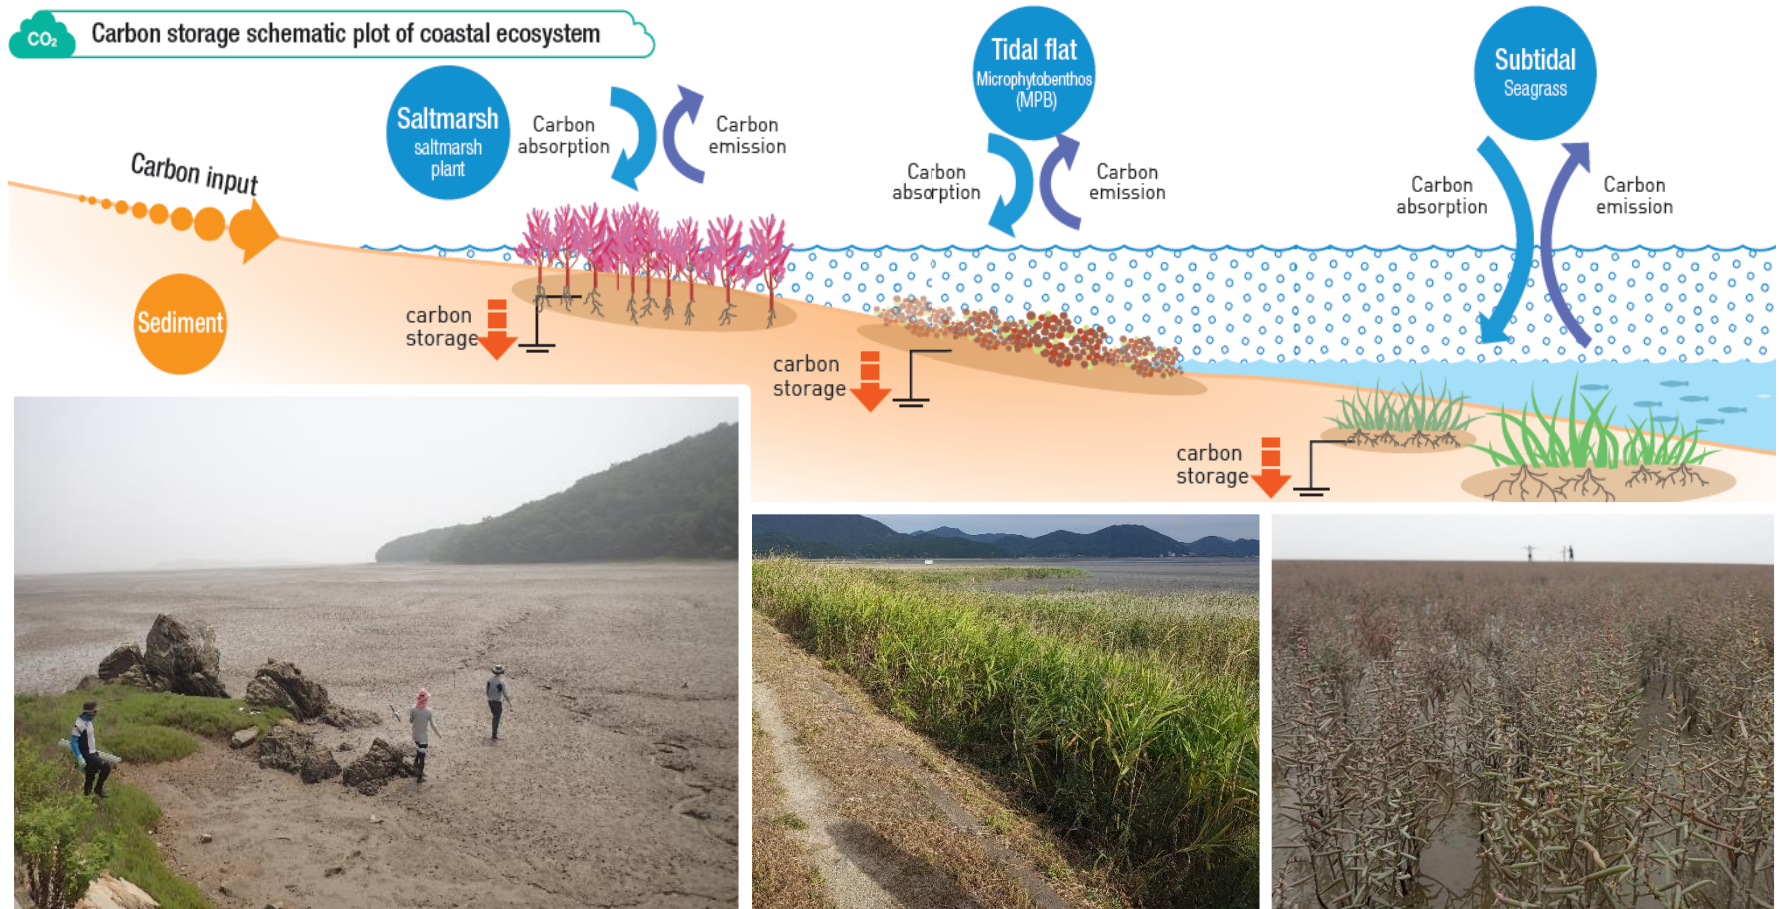

Fossil Fuel "Black Carbon"

Carbon emitted from fossil fuels and causes global warming

Blue Carbon?

Carbon Storage Schematic of Blue Carbon

■ **Potential carbon sources** in coastal area:
Microphytobenthos, salt marsh plant, and sea grass

Blue Carbon?

Carbon Storage Capacity of Blue Carbon

Saltmarsh

- Tidal flat, and Saltmarsh plant stocks are about **3 times higher** than tropical rain forest stocks
- Stored in soil organic carbon form mainly

Seagrass

- Seagrass stocks are about **2 times higher** than tropical rain forest stocks
- Exist in soil organic carbon form

(Blue Carbon initiative homepage)

Blue Carbon?

Global Distribution Status of Blue Carbon

Mangrove

Mangroves are Mainly Distributed in Tropical Regions such as **Indonesia, Mexico, and Brazil**

Saltmarsh

Tidal Flat, and Saltmarsh Mainly Distributed in **Europe, North America, and Australia**

Seagrass

60 Species of Seagrass are Distributed in All Coasts Except Antarctica

Global Distribution of Blue Carbon Ecosystems

Figure 4. Global distribution of the blue carbon ecosystems

Global Trend

■ IPCC Special Report on the Ocean and Cryosphere in a Changing Climate(SROCC)

Synopsis of SROCC

- Decided to publish **SROCC** within cycle of 6th IPCC report in the 43rd session of IPCC ('16.4, Kenya)
- Covering the interrelationships, changes, adaptation , and mitigation measures of the ocean, and cryosphere on climate system (6 chapters)

Main Blue Carbon Contents(Chapter 5)

- Blue carbon occupies less than 0.1% of the surface, but **contributes 1~10% of primary ocean production, and 3~30% of marine CO₂**
- **151 countries** around the world own blue carbon ecosystem
- 25~50% worldwide damage over past 100 years (decrease 0.2~3% per year)
→ **Emit 1.3 ± 0.7GtC/yr**
- Blue carbon has variety of benefits such as wave energy absorption, typhoon protection, adaptation (erosion protection), local marine ecosystems health promotion (fishery resources, water quality)

Global Trend

Ramsar Convention

13th Meeting of the Conference of the Contracting Parties
to the Ramsar Convention on Wetlands

"Wetlands for a Sustainable Urban Future"
Dubai, United Arab Emirates, 21-29 October 2018

Ramsar COP13 Doc.18.15 Rev.1

Draft resolution on promoting conservation, restoration and sustainable management of coastal blue carbon¹ ecosystems

Submitted by Australia

1. RECALLING:

- a. Resolution VIII.4 on *Wetland issues in Integrated Coastal Zone Management (ICZM)*, that urges Contracting Parties to ensure that coastal wetlands and their values and functions and their importance for the conservation of biological diversity, including their vital role in mitigating the impacts of climate change and sea-level rise, are fully recognized in their policies, planning and decision-making in the coastal zone;
- b. Resolution X.24 on *Climate change and wetlands*, that urges Contracting Parties to manage wetlands wisely to increase their resilience to climate change and take urgent action to reduce the degradation, promote restoration and improve management practice of wetland types that constitute significant greenhouse gas sinks;
- c. Resolution XI.14 on *Climate change and wetlands: implications for the Ramsar Convention on Wetlands*, that urges Contracting Parties to maintain or improve the ecological character of wetlands to promote the ability of wetlands to contribute to nature-based climate change adaptation;

Ramsar COP13

- Draft resolution on promoting conservation, restoration and sustainable management of coastal blue carbon ecosystems (COP13 Doc.18.15.)

Contents of draft resolution

- AFFIRMS the significant value of coastal wetlands for climate mitigation and adaptation
- Raise awareness of the benefits of coastal blue carbon ecosystems and Incentivize actions
- Collect and analyze data, map these ecosystem and make this information publicly accessible

⇒ KOREA clarified unvegetated mudflats as one of blue carbon ecosystems in draft resolution

Global Trend

United States of America—developing the inventory

- All wetlands are recognized as managed lands, mostly consisting of agricultural to tidal marsh transitions with restoration. Both Vegetated Coastal Wetlands and Unvegetated Open Water Coastal Wetlands were included, although sufficient data on seagrasses were not available (Crooks and Beers 2018).
- Accounting for transitions in land-use due to restoration activities (e.g. rewetting) is included. The reporting table (below) shows areas of cropland, grasslands and other land categories converted to coastal wetlands.
- An interagency working group was created to facilitate effective collaboration between government offices and a consultant team responsible for the accounts.
- Coastal wetlands sequester 8.5 MMTCO₂ each year, but erosion releases 1–7 MMTCO₂ per year (Crooks and Beers 2018).

Global Trend

Australia—Investigating inclusion of a range of activities (extraction)

- Australia has reported coastal wetlands within its GHG inventory, and reported mangroves within its forest category.
- Coastal wetlands are approximately 5% of national carbon stocks in the Forest sector.
- They are examining case studies for a range of activities, e.g. dredging of ports, harbours and marinas maintain navigable passages for boating and shipping and excavation due to canal estate development; and excavation for aquaculture.
- They convened a technical expert panel to provide advice on implementation of *2013 Supplement* for coastal wetlands within national GHG accounts.
- In the future, Australia plans to continue to incorporate new data to improve model values and identify and incorporate new activities to extend activity data coverage.

■ Annual Survey Plan

Pilot Survey(2017)

- Investigate Carbon Cycle Process through Domestic, and Foreign Literatures
- Measure Organic Carbon Change by Time Series in Pilot Survey Area

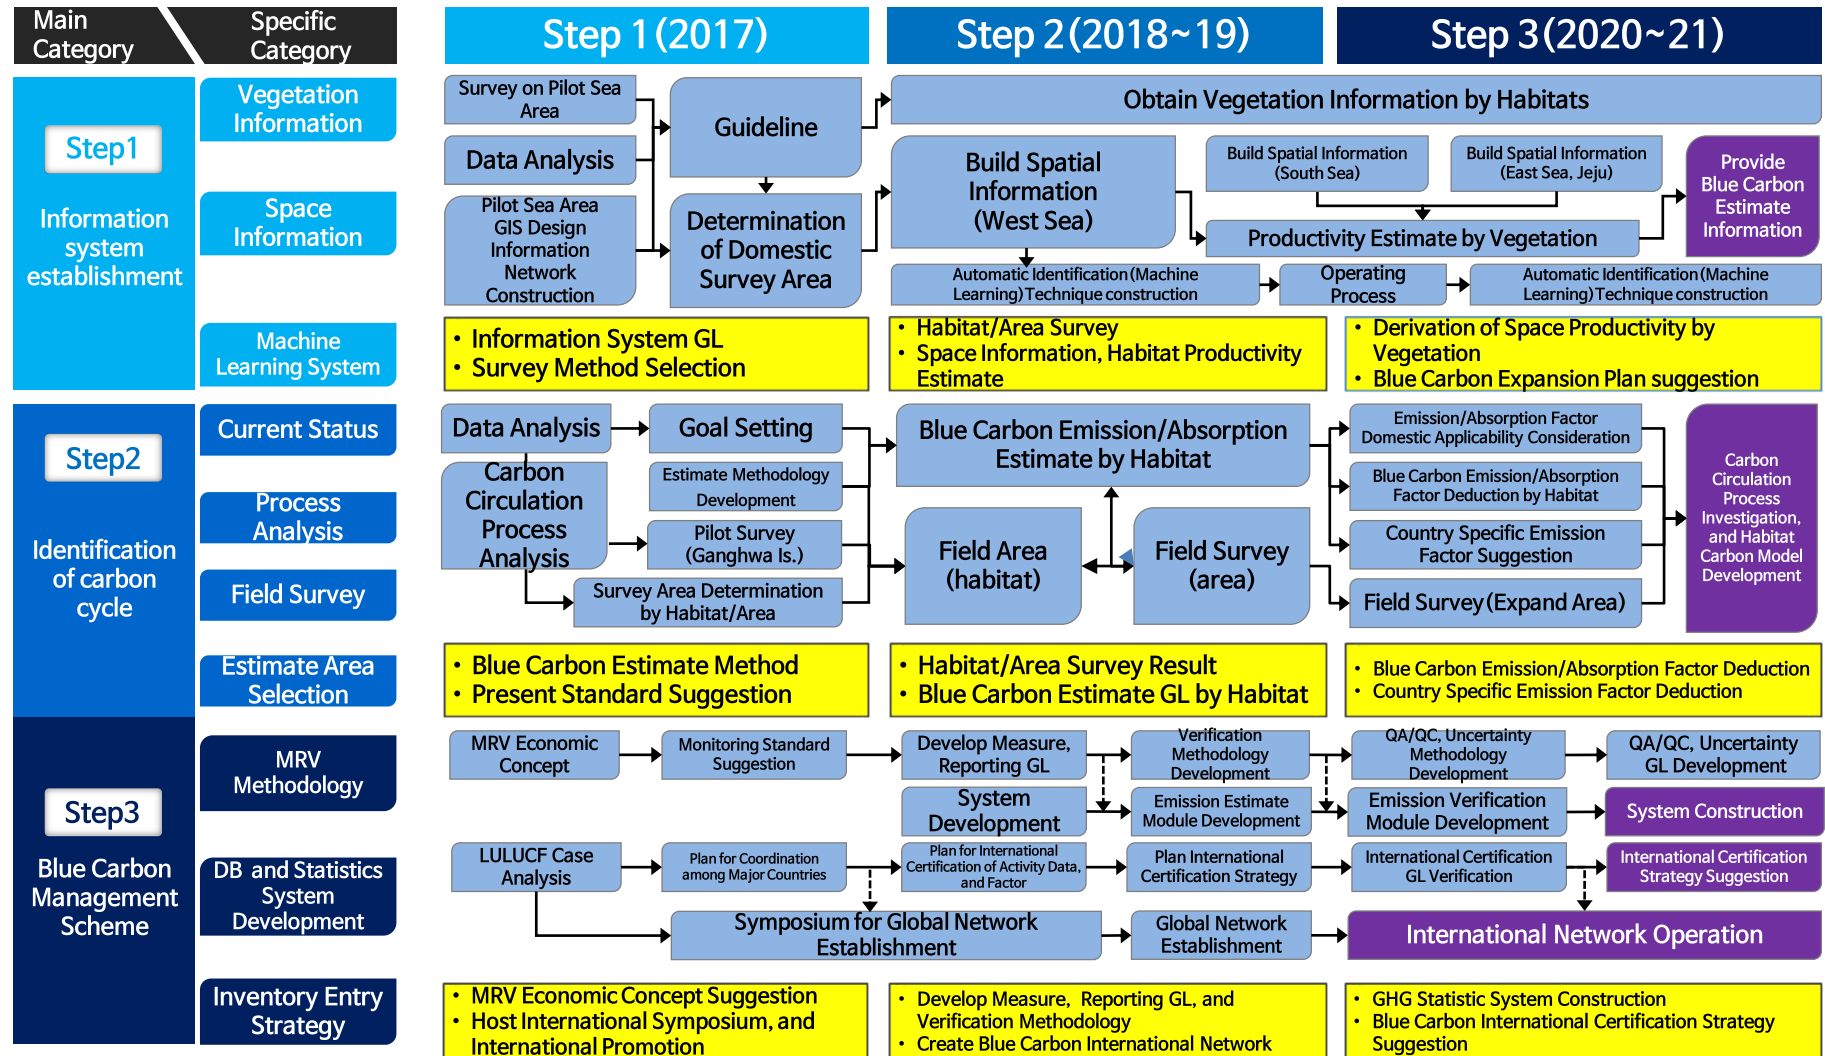

Practical Survey(2018~2020)

- Measure, and Analyze Organic Carbon Change by Time Series in Blue Carbon Area - Carbon Measure, and Analyze in Tidal Flat(20 area), Saltmarsh(18area), and Seagrass(7area)

Blue Carbon R&D

Roadmap of blue carbon research

III. Recent Main Result

▪ 2017~ 2018. 11.

How to Estimate

Estimate of Coastal Wetland Carbon Storage

1 Field sampling 1-3m depth coring at field sites

2 Sample separation by depth The sample were cut by depth (1cm)

3 Oven drying Measuring **bulk density** after the oven drying (65°C, 72h)

5-1 High temperature drying Measuring **organic matter(OM)** after drying at 550 °C, 4h

4 Grinding the Dried samples

5-2 Freeze-drying Measuring **total organic carbon(TOC)** content after 1M-HCl treatment and freeze-drying for about 12-24 h

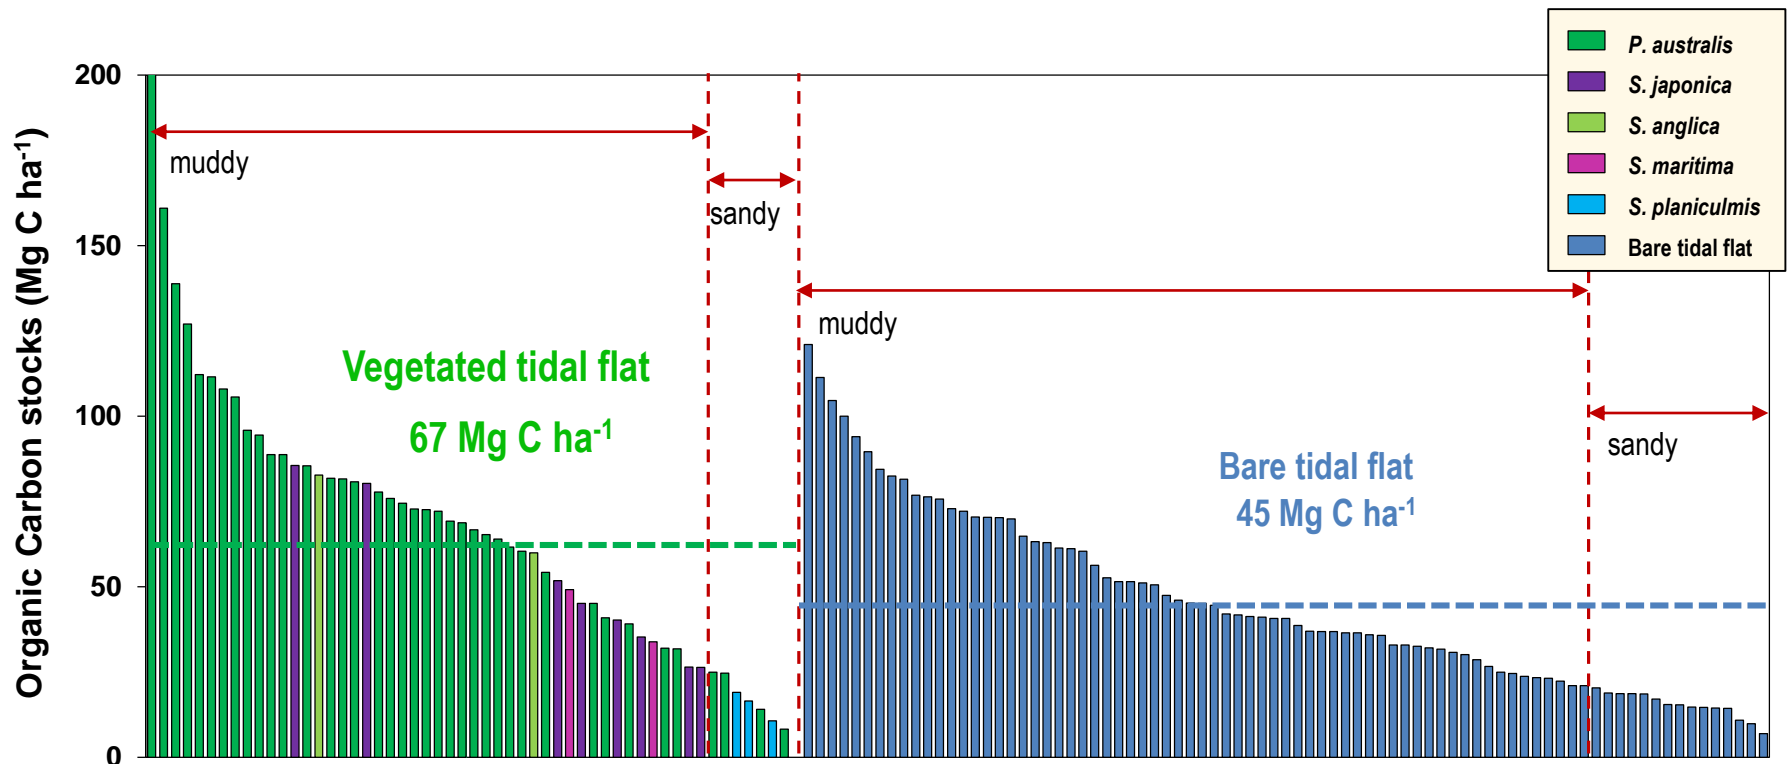

*Carbon content(%) and carbon stable isotope ratio in samples

Result

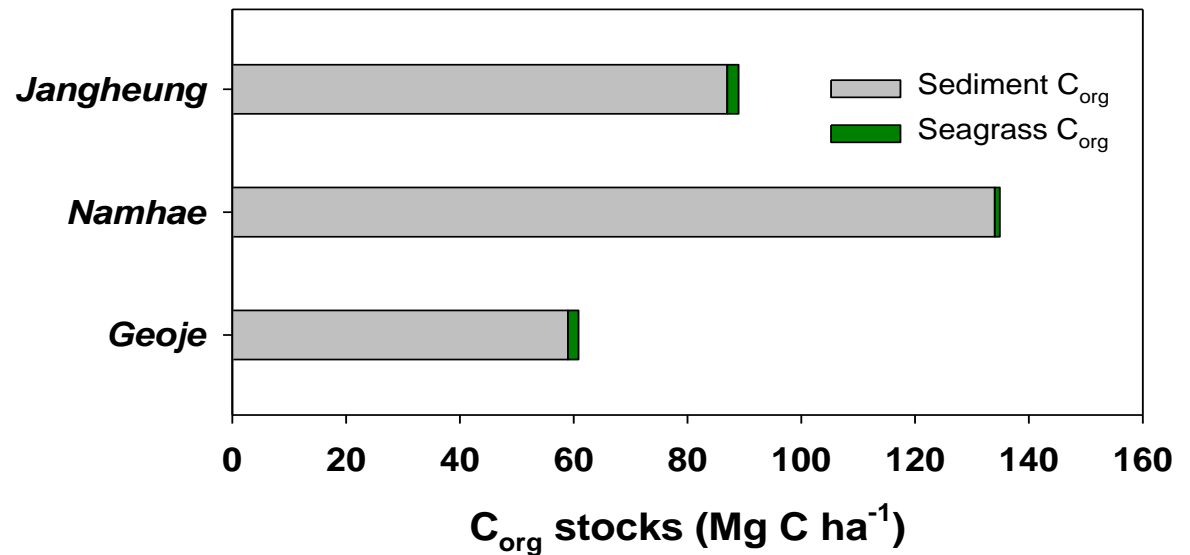

Results of Organic Carbon Storage in Tidal Flat Sediments

- Relatively Higher Organic Carbon Stocks in Vegetated Areas than Mudflat
- **Organic Carbon Storage Ability** of Vegetated Area is **150%** Compared to Non-vegetated Area

Effects of SO₂ contamination on rising CO₂ drops under high pressure

Do Hwang, Taehyung, Joo Hyun, Hwang, Jang H. Lee, Hwang, H. Seung

Received: 1 May 2017 / Accepted: 27 February 2018
© Springer International Publishing AG 2018

Abstract Although the flow dynamics of pore liquid along microtubules have been studied for long, the specific mechanism is not clearly applicable to the pore media. The formation of capillary bridges between the pore and the pore liquid is a key factor in determining the flow of pore and the pore liquid. In this study, we investigated the flow of pore and the pore liquid under high pressure. The flow of pore and the pore liquid was measured by using a microtubule array. The flow of pore and the pore liquid was measured by using a microtubule array. The flow of pore and the pore liquid was measured by using a microtubule array.

Keywords: SO₂ contamination, CO₂ drops, high pressure, microtubule array, pore liquid, flow dynamics

IV. Challenges and lessons

Challenges & lessons

■ Survey location&cycle

- What are the criteria to decide a survey location&cycle?
- We handled this problem in SOP briefly. But, I think that we need more study and field survey.

■ Activity Data

- How do we get past activity data to monitor greenhouse gas?
- We will study using a satellite photograph next year.

KOEM's event

■ Blue carbon workshop

UNFCCC COP24 Side event
